

IoT LoRa application service Tutorial

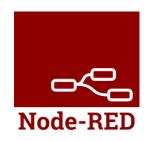

F. Ferrero

Node Red – InFluxDB - GRAFANA

Node Red

- Node-RED is a programming tool for wiring together hardware devices, APIs and online services in new and interesting ways.
- It provides a browser-based editor that makes it easy to wire together flows using the wide range of nodes in the palette that can be deployed to its runtime in a single-click.
- Built on Node.js
 - The light-weight runtime is built on Node.js, taking full advantage of its event-driven, non-blocking model. This makes it ideal to run at the edge of the network on low-cost hardware such as the Raspberry Pi as well as in the cloud.

InfluxDB

InfluxDB

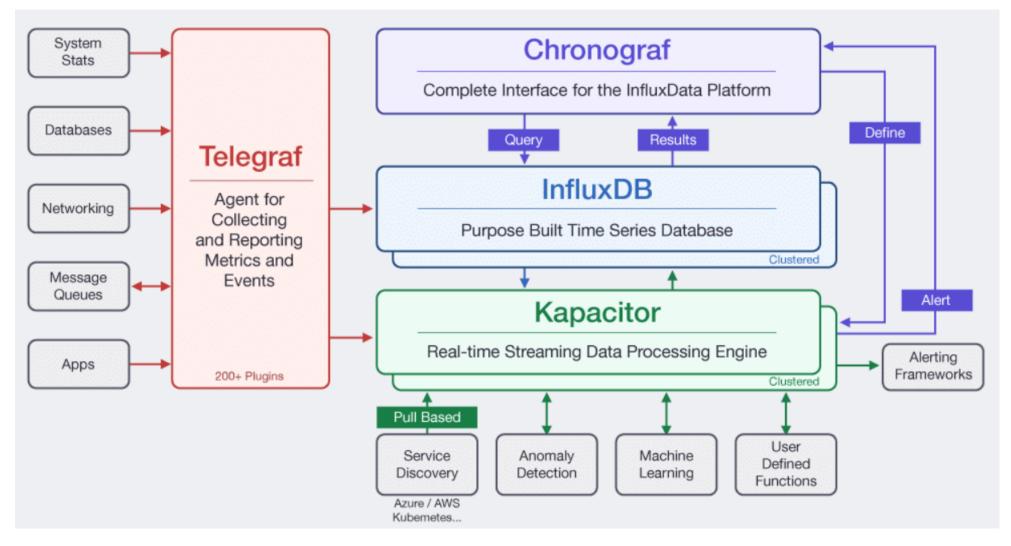

- InfluxDB is an open source distributed time series database developed by InfluxData. The
 main advantage of InfluxDB is its capacity to aggregate values in time buckets on-the-fly
 without any manual intervention.
- InfluxDB can be accessed by software like Grafana, which is a powerful front-end tool
 providing visualisation features for time series data. Each point consists of varied key-value
 pairs called fieldset and timestamp. Points are indexed by their time and tagset. InfluxDB
 stores data via HTTP, TCP and UDP.

Features

- Purely written in the Go programming language and facilitates compilation into a single binary with no external dependencies.
- High performance customised data store written especially for time series data. The TSM engine of InfluxDB allows efficient and high speed data storage and compression.
- In-built Web front-end tool for database and user administration.
- Competent in merging multiple series together.
- Official website: https://www.influxdata.com/

InfluxDB

Additionaly to the database, influx data provide interesting applications

- Grafana allows you to query, visualize, alert on and understand your metrics no matter where they are stored. Create, explore, and share dashboards with your team and foster a data driven culture.
- Grafana includes a built in Graphite query parser that takes writing graphite metric expressions to a whole new level. Expressions are easier to read and faster to edit than ever.
- Click on any metric segment to change it
- Quickly add functions (search, typeahead)
- Click on a function parameter to change it
- Move function order to the left or right
- Direct link to Graphite function documentation
- Rich templating support

Node-Red

Please install Node Red and TTn lib

https://www.thethingsnetwork.org/docs/applications/nodered/quick-start.html

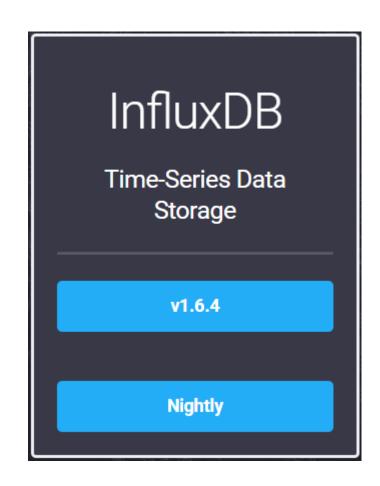

If git is not installed on your PC: https://git-scm.com/downloads

You will also need to install: node-red-contrib-influxdb

Influx DB Data base

Please install InfluxDB v1.6.4

https://portal.influxdata.com/downloads

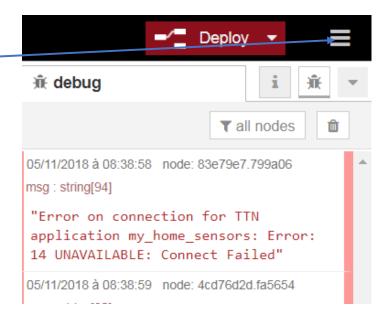

• Please install Grafana

https://grafana.com/get

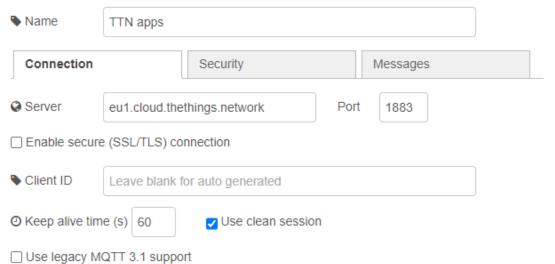

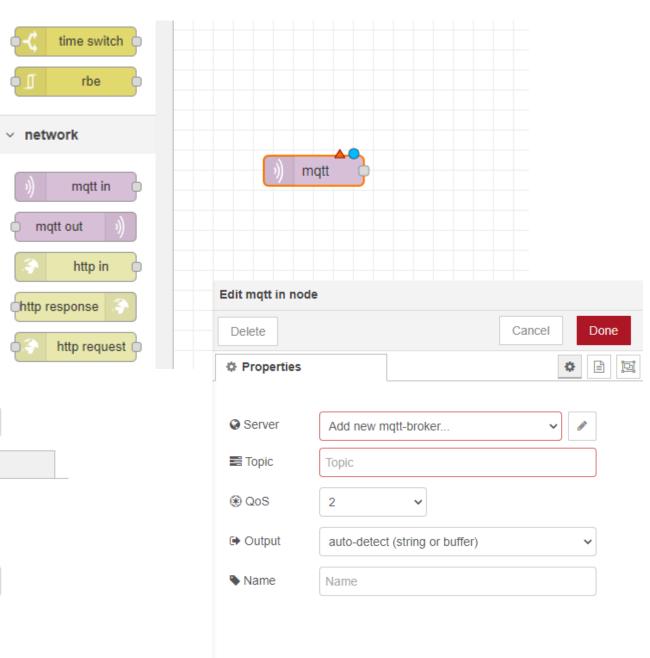

- Start NODE.js command prompt
- Run : node-red
- Open your web browser and go to http://127.0.0.1:1880
- On the editor, click here And go to palette editor Install:
- node-red-contrib-influxdb

```
node-red
Your environment has been set up for using Node.js 10.13.0 (x64) and npm.
C:\Users\hp_sim>node-red
5 Nov 06:02:48 - [info]
Welcome to Node-RED
5 Nov 06:02:48 - [info] Node-RED version: v0.19.5
5 Nov 06:02:48 - [info] Node.js | version: v10.13.0
 Nov 06:02:48 - [info] Windows_NT 6.1.7601 x64 LE
 Nov 06:02:50 - [info] Loading palette nodes
 Nov 06:02:52 - [warn] rpi-gpio : Raspberry Pi specific node set inactive
 Nov 06:02:52 - [warn] [node-red/tail] Not currently supported on Windows
 Nov 06:02:52 - [info] Settings file : \Users\hp_sim\.node-red\settings.js
 Nov 06:02:52 - [info] Context store : 'default' [module=memory]
5 Nov 06:02:52 - [info] User directory : \Users\hp_sim\.node-red
 Nov 06:02:52 - [warn] Projects disabled : editorTheme.projects.enabled=false
                                     : \Users\hp_sim\.node-red\flows_hp_sim-HP
5 Nov 06:02:52 - [info] Flows file
 json
5 Nov 06:02:52 - [warn]
```

- You have the graphical Node-red editor
- Add mqtt in node
- Edit mqtt
- Choose « Add new mqtt-broker
 ... » in App and click on edit

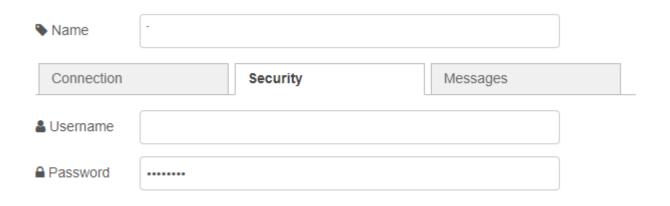

Update security and topic:

discovery.thethingsnetwork.org:1900

- Go to you application in TTN
- Copy past the User name and keys

v3/uca-project@ttn/devices/device_name/up

MQTT

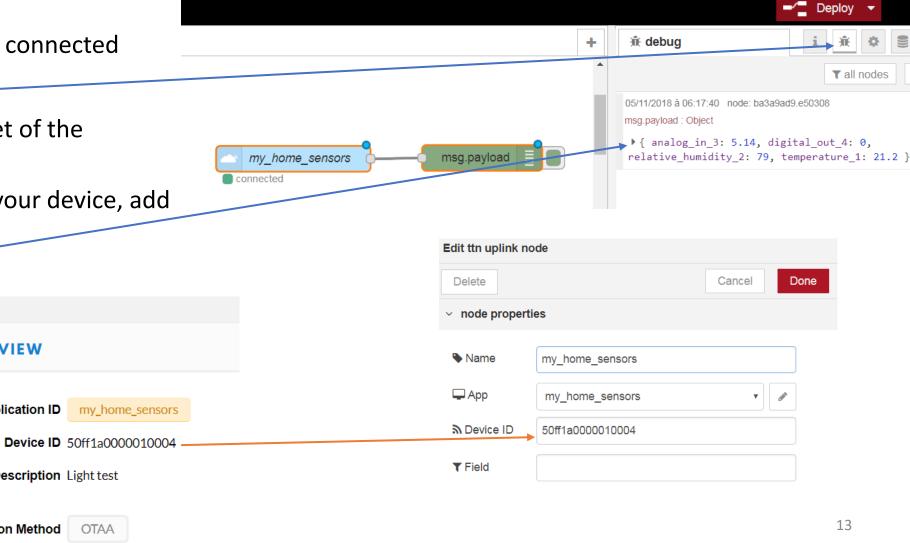

The Application Server exposes an MQTT server to work with streaming events. In order to use the MQTT server you need to create a new API key, which will function as connection password. You can also use an existing API key, as long as it has the necessary rights granted. Use the connection information below to connect.

Connection credentials		
Public address	eu1.cloud.thethings.network:1883	
Public TLS address	eu1.cloud.thethings.network:8883	
Username	uca-project@ttn	
Password	Generate new API key Go to API keys	

- Click on Deploy
- You uplink TTN should be connected
- Click on debug window
- You will receive the packet of the application
- If you want to filter only your device, add your device ID

DEVICE OVERVIEW

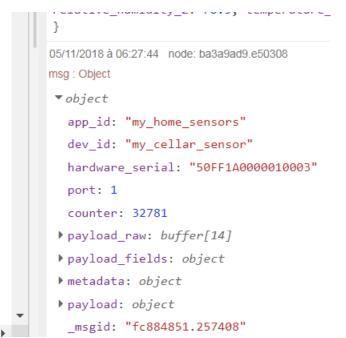

Click here :

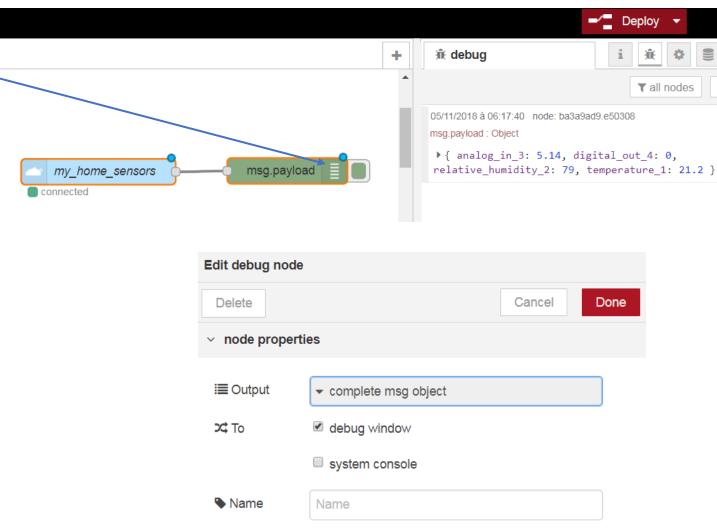

Description Light test

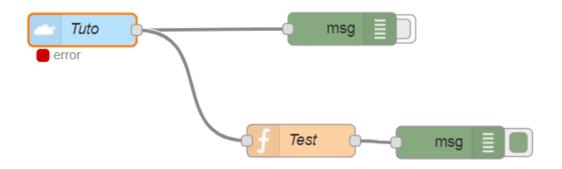

Application ID

- Click here:
- Choose « complete msg object »
- And Deploy
- You have now more information of your uplink

- If you want to extract only 1 data,
- as an exemple the RSSI (received signal Strength indicator
- Use a function to extract the wanted data

```
return {
  // Some fields from the metadata freq:
  msg.metadata.frequency,
  cr: msg.metadata.cr,
  dr: msg.metadata.dr,

// Combine RSSI and SNR of all gateways into two arrays:
  rssi: gateways.map(gw => gw.rssi),
  snr: gateways.map(gw => gw.snr),

};
```

InfluxDB

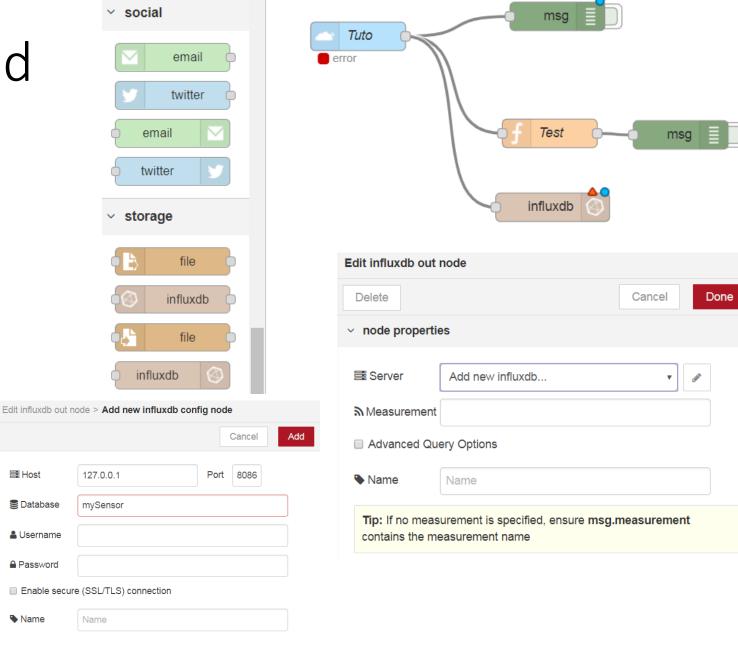

- Run « influxd.exe » , it will start the database
- Run « influx.exe », it will open a shell
- Write: « CREATE DATABASE mySensor »
- Then write: « SHOW DATABASE »

Your database is created

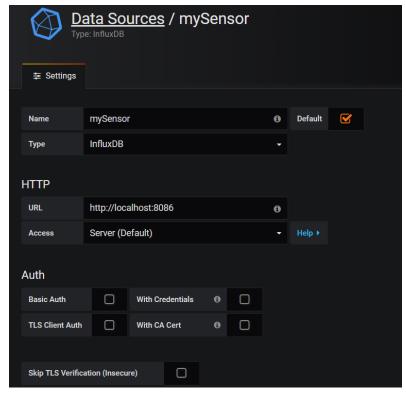

```
> CREATE DATABASE mySensor
> SHOW DATABASES
name: databases
name
----
_internal
tuto
mySensor
>
```

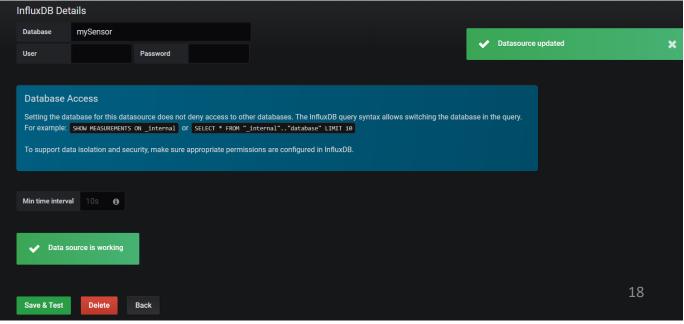

InfluxDB - Node Red

- How to store data in your database?
- Add an influxdb storage and connect it to your uplink
- Define a server, just add the Database name : mySensor
- Add
- In measurement field, add a name for your device: device1
- Go to InfluxDB shell
- Run: SHOW SERIES ON mySensor

- Go to your unzip Grafana directory/bin
- Start grafana-server.exe
- Go to : http://127.0.0.1:3000
- User name and password is: admin
- Provide a new password
- Click « Add data source »
- Add a name
- Choose InfluxDB type
- Define Database name « mySensor »
- Click on Save and Test

- Create a new dashboard
- Click on Graph
- Panel Title / Edit
- Select your data source and measurement, field temperature, time 1s, fill linear
- Change to the last 5mn
- Put your finger on the sensor
- Look at your curve
- To speed your measurement :

In Arduino code, change Tx interval to be 20s for SF7

```
case DR_SF7: debugPrintLn(F("Datarate: SF7"));
    TX_INTERVAL = 20;
```

Good luck for you projects!
